- (ii) That continuously monitors the fuel system and warns the pilot of any fuel flow trend that could lead to engine failure.
- (5) A manifold pressure indicator for each altitude engine and for each engine with a controllable propeller.
- (6) For each turbocharger installation:
- (i) If limitations are established for either carburetor (or manifold) air inlet temperature or exhaust gas or turbocharger turbine inlet temperature, indicators must be furnished for each temperature for which the limitation is established unless it is shown that the limitation will not be exceeded in all intended operations.
- (ii) If its oil system is separate from the engine oil system, oil pressure and oil temperature indicators must be provided
- (7) A coolant temperature indicator for each liquid-cooled engine.
- (c) For turbine engine-powered airplanes. In addition to the powerplant instruments required by paragraph (a) of this section, the following powerplant instruments are required:
- (1) A gas temperature indicator for each engine.
- (2) A fuel flowmeter indicator for each engine.
- (3) A fuel low pressure warning means for each engine.
- (4) A fuel low level warning means for any fuel tank that should not be depleted of fuel in normal operations.
- (5) A tachometer indicator (to indicate the speed of the rotors with established limiting speeds) for each engine.
- (6) An oil low pressure warning means for each engine.
- (7) An indicating means to indicate the functioning of the powerplant ice protection system for each engine.
- (8) For each engine, an indicating means for the fuel strainer or filter required by §23.997 to indicate the occurrence of contamination of the strainer or filter before it reaches the capacity established in accordance with §23.997(d).
- (9) For each engine, a warning means for the oil strainer or filter required by §23.1019, if it has no bypass, to warn the pilot of the occurrence of contamination of the strainer or filter screen be-

- fore it reaches the capacity established in accordance with §23.1019(a)(5).
- (10) An indicating means to indicate the functioning of any heater used to prevent ice clogging of fuel system components.
- (d) For turbojet/turbofan engine-powered airplanes. In addition to the power-plant instruments required by paragraphs (a) and (c) of this section, the following powerplant instruments are required:
- (1) For each engine, an indicator to indicate thrust or to indicate a parameter that can be related to thrust, including a free air temperature indicator if needed for this purpose.
- (2) For each engine, a position indicating means to indicate to the flight crew when the thrust reverser, if installed, is in the reverse thrust position.
- (e) For turbopropeller-powered airplanes. In addition to the powerplant instruments required by paragraphs (a) and (c) of this section, the following powerplant instruments are required:
- (1) A torque indicator for each engine.
- (2) A position indicating means to indicate to the flight crew when the propeller blade angle is below the flight low pitch position, for each propeller, unless it can be shown that such occurrence is highly improbable.

[Doc. No. 26344, 58 FR 18975, Apr. 9, 1993; 58 FR 27060, May 6, 1993; Amdt. 23–51, 61 FR 5138, Feb. 9, 1996; Amdt. 23–52, 61 FR 13644, Mar. 27, 1996]

# § 23.1306 Electrical and electronic system lightning protection.

- (a) Each electrical and electronic system that performs a function, for which failure would prevent the continued safe flight and landing of the airplane, must be designed and installed so that—
- (1) The function is not adversely affected during and after the time the airplane is exposed to lightning; and
- (2) The system automatically recovers normal operation of that function in a timely manner after the airplane is exposed to lightning.
- (b) For airplanes approved for instrument flight rules operation, each electrical and electronic system that performs a function, for which failure

#### § 23.1307

would reduce the capability of the airplane or the ability of the flightcrew to respond to an adverse operating condition, must be designed and installed so that the function recovers normal operation in a timely manner after the airplane is exposed to lightning.

[Doc. No. FAA-2010-0224, Amdt. 23-61, 76 FR 33135, June 8, 2011]

#### §23.1307 Miscellaneous equipment.

The equipment necessary for an airplane to operate at the maximum operating altitude and in the kinds of operation and meteorological conditions for which certification is requested and is approved in accordance with §23.1559 must be included in the type design.

[Doc. No. 4080, 29 FR 17955, Dec. 18, 1964; 30 FR 258, Jan. 9, 1965, as amended by Amdt. 23–23, 43 FR 50593, Oct. 30, 1978; Amdt. 23–43, 58 FR 18976, Apr. 9, 1993; Amdt. 23–49, 61 FR 5168, Feb. 9, 1996]

### § 23.1308 High-intensity Radiated Fields (HIRF) Protection.

- (a) Except as provided in paragraph (d) of this section, each electrical and electronic system that performs a function whose failure would prevent the continued safe flight and landing of the airplane must be designed and installed so that—
- (1) The function is not adversely affected during and after the time the airplane is exposed to HIRF environment I, as described in appendix J to this part;
- (2) The system automatically recovers normal operation of that function, in a timely manner, after the airplane is exposed to HIRF environment I, as described in appendix J to this part, unless the system's recovery conflicts with other operational or functional requirements of the system: and
- (3) The system is not adversely affected during and after the time the airplane is exposed to HIRF environment II, as described in appendix J to this part.
- (b) Each electrical and electronic system that performs a function whose failure would significantly reduce the capability of the airplane or the ability of the flightcrew to respond to an adverse operating condition must be designed and installed so the system is not adversely affected when the equip-

ment providing the function is exposed to equipment HIRF test level 1 or 2, as described in appendix J to this part.

- (c) Each electrical and electronic system that performs a function whose failure would reduce the capability of the airplane or the ability of the flightcrew to respond to an adverse operating condition must be designed and installed so the system is not adversely affected when the equipment providing the function is exposed to equipment HIRF test level 3, as described in appendix J to this part.
- (d) Before December 1, 2012, an electrical or electronic system that performs a function whose failure would prevent the continued safe flight and landing of an airplane may be designed and installed without meeting the provisions of paragraph (a) provided—
- (1) The system has previously been shown to comply with special conditions for HIRF, prescribed under §21.16, issued before December 1, 2007:
- (2) The HIRF immunity characteristics of the system have not changed since compliance with the special conditions was demonstrated; and
- (3) The data used to demonstrate compliance with the special conditions is provided.

[Doc. No. FAA–2006–23657, 72 FR 44024, Aug. 6, 2007]

## § 23.1309 Equipment, systems, and installations.

- (a) Each item of equipment, each system, and each installation:
- (1) When performing its intended function, may not adversely affect the response, operation, or accuracy of any—
- (i) Equipment essential to safe operation; or
- (ii) Other equipment unless there is a means to inform the pilot of the effect.
- (2) In a single-engine airplane, must be designed to minimize hazards to the airplane in the event of a probable malfunction or failure.
- (3) In a multiengine airplane, must be designed to prevent hazards to the airplane in the event of a probable malfunction or failure.
- (4) In a commuter category airplane, must be designed to safeguard against hazards to the airplane in the event of their malfunction or failure.
